the study of macroeconomics can seem a daunting project the field is complex and sometimes poorly defined and there are a variety of competing approaches it is easy for the senior bachelor and starting master student to get lost in the forest of macroeconomics and the mathematics it uses extensively foundations of modern macroeconomics is a guide book for the interested and ambitious student non partisan in its approach it deals with all the major topics summarising the important approaches and providing the reader with a coherent angle on all aspects of macroeconomic thought each chapter deals with a separate area of macroeconomics and each contains a summary section of key points and a further reading list using nothing more than undergraduate mathematical skills it takes the student from basic is lm style macro models to the state of the art literature on dynamic stochastic general equilibrium explaining the mathematical tricks used where they are first introduced fully updated and substantially revised this third edition of foundations of modern macroeconomics now includes brand new chapters covering highly topical subjects such as dynamic programming competitive risk sharing equilibria and the new keynesian dsge approach

this textbook introduces graduate and upper undergraduate students to dynamic stochastic general equilibrium dsge models as dsge models become integral in advanced coursework this book serves as an invaluable guide explaining the complexities with a methodological red thread across its five chapters starting with the stochastic dynamic models of the real business cycle rbc and progressing through the field of new keynesian macroeconomics nke it employs dsge models to shed light on the dynamic nature of economic systems the book presents the blanchard kahn methodology for theoretical solutions discussing its usefulness and limitations as models evolve in complexity the book goes on to explain the shift from analytical to numerical solutions showcasing the dynare software and providing coding insights unique to

this volume is a chapter on difference equations equipping students with essential mathematical tools and a concluding exploration of a medium sized newkeynesian economics model this book will equip students to navigate the theoretical complexities of the topic and to independently replicate and comprehend the presented results it bridges the gap between classical and keynesian paradigms reviving the debate in today s rbc vs nke landscape it will enable students to master the essence of macroeconomic theories and methodologies paving the way for their scholarly pursuits

it is commonly believed that macroeconomic models are not useful for policy analysis because they do not take proper account of agents expectations over the last decade mainstream macroeconomic models in the uk and elsewhere have taken on board the rational expectations revolution by explicitly incorporating expectations of the future in principle one can perform the same technical exercises on a forward expectations model as on a conventional model and more rational expectations in macroeconomic models deals with the numerical methods necessary to carry out policy analysis and forecasting with these models these methods are often passed on by word of mouth or confined to obscure journals rational expectations in macroeconomic models brings them together with applications which are interesting in their own right there is no comparable textbook in the literature the specific subjects include i solving for model consistent expectations ii the choice of terminal condition and time horizon iii experimental design i e the effect of temporary vs permanent anticipated vs unanticipated shocks deterministic vs stochastic dynamic vs static simulation iv the role of exchange rate v optimal control and inflation output tradeoffs the models used are those of the liverpool research group in macroeconomics the london business school and the national institute of economic and social research

an advanced treatment of modern macroeconomics presented through a sequence of dynamic equilibrium models with discussion of the implications for monetary and fiscal policy this textbook offers an advanced treatment of modern macroeconomics presented through a sequence of dynamic general equilibrium models based on intertemporal optimization on the part of economic agents the book treats macroeconomics as applied and policy oriented general equilibrium analysis examining a number of models each of which is suitable for investigating specific issues but may be unsuitable for others after presenting a brief survey of the evolution

of macroeconomics and the key facts about long run economic growth and aggregate fluctuations the book introduces the main elements of the intertemporal approach through a series of two period competitive general equilibrium models the simplest possible intertemporal models this sets the stage for the remainder of the book which presents models of economic growth aggregate fluctuations and monetary and fiscal policy the text focuses on a full analysis of a limited number of key intertemporal models which are stripped down to essentials so that students can focus on the dynamic properties of the models exercises encourage students to try their hands at solving versions of the dynamic models that define modern macroeconomics appendixes review the main mathematical techniques needed to analyze optimizing dynamic macroeconomic models the book is suitable for advanced undergraduate and graduate students who have some knowledge of economic theory and mathematics for economists

many methods have been proposed for the solution and simulation of medium or large size models under the assumption of rational expectations the purpose of this paper is to present these methods and to show how and where each can be applied the methods fall into two groups methods in the first can be used to solve for perfect foresight paths in non linear models methods in the second can be used in linear models to solve either for paths or processes followed by endogenous variables all the methods described here have been used in empirical applications and computer algorithms are available for most

this textbook is a thorough introduction to the theory and practice of macroeconomic modelling it provides a rigorous exposition of the theory of modelling and examines the main uk and european macroeconomic models policy relevant conclusions are drawn from the models including new areas such as wealth effects and rational expectations the text compares uk macroeconomic models with key us and european models with an emphasis on policy analysis and the erm

this paper examines five examples of rational expectations models with a continuum of convergent solutions and demonstrates serious difficulties in the economic interpretation of these solutions the five examples are 1 a model of optimal capital accumulation with a negative rate of time preference 2 taylor s 1977 linear rational expectations model of macroeconomic equilibrium 3 calvo s 1984 model of contract setting and price dynamics 4 obfstfeld s 1984 equilibrium model of monetary dynamics with individual optimizing agents and 5 calvo s 1978

life cycle model of savings and asset valuation in every case when these models yield a continuum of convergent infinite horizon solutions these solutions fail to exhibit economically appropriate forward looking dependence of the endogenous variables on the paths of the exogenous forcing variables a difficulty that does not arise under the circumstances where these models yield unique convergent infinite horizon solutions further the three models that have natural finite horizon versions either lack finite horizon solutions or have solutions that do not converge to any of the infinite horizon solutions again this difficulty arises only under the circumstances where these models have a continuum of infinite horizon solutions

this paper considers the possibility that in linear rational expectations models all determinate uniquely non explosive solutions coincide with the minimum state variable msv solution which is unique by construction in univariate specifications of the form $y_t = a + b y_{t-1} + c u_t$ that result holds if a rational solution is unique and non explosive then it is the same as the msv solution also this result holds for multivariate versions if the a and c matrices commute and a certain regularity condition holds more generally however there are models of this form that possess unique non explosive solutions that differ from their msv solutions examples are provided and a strategy for easily constructing others is outlined

this volume brings together 12 essays on macroeconomic policy in the open economy the subject matter is divided equally between analyses of the internal and external adjustment problems of small open economies and studies of the behaviour of large interdependent countries

using variants of a modified version of dornbusch's model of price level and exchange rate dynamics it is demonstrated that satisfaction of the formal condition for existence of a unique non explosive solution of a linear rational expectations model with forward and backward looking dynamic processes equality of the number of stable roots with the number of independent backward looking processes does not guarantee the economic sensibility of this solution even if one accepts the usual arguments for excluding speculative bubbles from the solutions of such models moreover satisfaction of the formal condition for existence of an infinity of non explosive solutions for such rational expectations models more stable roots than

independent backward looking processes does not assure that any of these solutions is economically sensible

revised topics in this textbook cover immigrants wages geography affecting income cyclical income changes credit limits and borrowing dozens of models help to illustrate numerous disagreements over answers to research questions
